

24379

**B.Tech. 6th Semester (Civil Engg.) Examination,**

**May-2012**

**IRRIGATION ENGG-I**

**Paper - CE-304-F**

*Time allowed : 3 hours]*

*[Maximum marks : 100*

*Note : Attempt five questions in all. Question No. 1 is compulsory and solve one question from each Section. All questions carry equal marks. Draw neat sketches. Assume any design data if missing.*

1. (a) What is meant by 'Piping' on foundation of a weir?
- (b) What do you understand by exit gradient?
- (c) What are spillways?
- (d) What is the difference between a weir and a barrage?
- (e) What is meant by 'canal escapes'?
- (f) What is cistern element?
- (g) What is meant by falls?
- (h) Define syphon and super passage.  $8 \times 2.5 = 20$

**Section - A**

2. (a) Enunciate the principle of design of Sarda type fall.
- (b) Design a 1.5<sup>m</sup> Sarda type fall on a channel carrying 22.5 cumecs with a bed width of 18<sup>m</sup> and water depth of 1.52<sup>m</sup>.  $8+12=20$
3. (a) What is the importance of cistern element and in how many classes you will place it for a fall? Discuss in detail.
- (b) How will you distinguish between a cross regulator and a head regulator? Explain.  $12+8=20$

**Section-B**

4. (a) What is meant by Cross-drainage works?
- (b) Draw a typical layout plan of a diversion head work scheme, when two canals are off-taking from the river, one on each side.  $6+14=20$
5. (a) Explain Bligh's Creep theory for design of weirs on permeable foundations. How is Khosla's theory an improvement on it?
- (b) What are the causes of failures of weirs? Suggest the remedies.  $12+8=20$

**Section-C**

6. (a) Describe briefly how you would fix the storage capacity of a reservoir and hence height of dam required for this storage.
- (b) If a dam is found to have high uplift pressures, how would you improve so that uplift is reduced.
- 8+12=20
7. (a) What are the points to be considered while selecting site for a dam? Describe necessary investigations thereof.
- (b) What are the causes of failure of a gravity dam and what precautions should be taken against failure?
- 10+10=20

**Section-D**

8. Describe the following with neat sketches :

- (a) Drop Spillway
- (b) Syphon Spillway
- (c) Ogee Spillway
- (d) Chute Spillway
- (e) Side Channel Spillway

5×4=20

9. (a) State the necessity of Spillway and how and where is it located? 8
- (b) An overfall Spillway crest is 100.0<sup>m</sup> above river bed. The design head for spillway is 8.0<sup>m</sup>. The tail water depth above river bed for design flood is 17.5<sup>m</sup> and the river bed is sound rock. Suggest a suitable energy dissipator. 12
