PM Generation

Modulation is the process or technique in which some parameter of carrier signal is varied acc. to the modulating signal the parameters may be amplitude, frequency, or phase.

Msg. ←

Amplitude Modulation Amplitude is varied acc to modulated signal, and phase and frequency get constant

Frequency Modulation frequency is varied acc to modulated signal, and amplitude & phase get constant

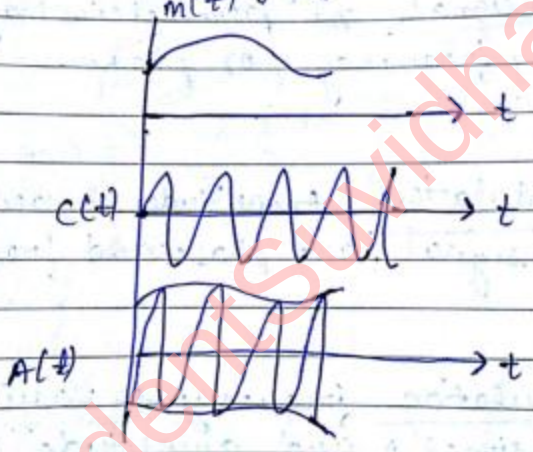
Phase Modulation phase is varied acc to the modulated signal, and amplitude & frequency gets constant

$$f_c \geq 2 \cdot f_m$$

## Need Of modulation

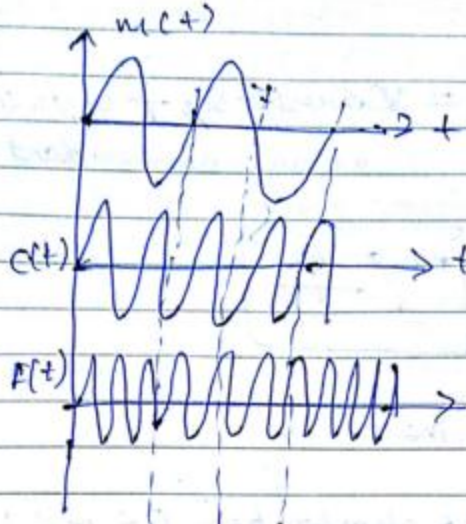
- ease of radiation
- much more long distance can be covered.
- antenna height
- multiplexing

## AM through Analog signal



## FM

FM



~~Modulated Index~~ :

AM

$S(t)_{AM} = ?$

$V_m$ & $V_c$ amplitude of message & carrier signal

$w_c$ & $w_m$ angular speed.

let $m(t) = V_m \sin w_m t$

$c(t) = V_c \sin w_c t$

$s(t)_{AM} = V_c \sin w_c t + V_m \sin_m t \sin \omega t$

$\frac{V_m}{V_c} = m$

$S(t)_{AM} = V_c \sin w_c t + \frac{V_m}{2} \cos(w_c - w_m) + \frac{V_m}{2} \cos(w_c + w_m)$

$= V_c \left( \sin w_c t + \frac{V_m}{2V_c} \cos(w_c - w_m) + \frac{V_m}{2V_c} (w_c + w_m \right.$

LP UP

$\left. = V_c \left( \sin w_c t + \frac{m}{2} \cos(w_c - w_m)t + \frac{m}{2} (\cos(w_c + w_m \right) \right.$

m = modulation index

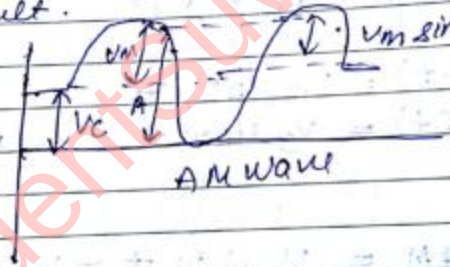
$s(t)$ = Carrier sig + upper side band component + lower side band component

$$M = \frac{V_m}{V_c}$$

## Modulation Index (m)

(i) It should be $0 < M \leq 1$

If $M > 1$, over modulation occur & recovery of message signal become difficult.



$$V_M = M V_C$$

$$V_M = V_{max} - V_{min}$$

$$V_C = \frac{V_{max} - V_{max} - V_{min}}{2}$$

$$\therefore V_C = \frac{2_{max} - V_{max} - V_{min}}{2}$$

# Data Encoding
