

ROUTING

1. Direct Routing
2. Indirect Routing

Direct Routing $\Rightarrow$ If the travel b/w two cities is either on a nonstop flight or a direct flight which may one or more intermediate half but where the passenger does not have to change the aircraft but continues on to his or her destination. After such routing are referred to as direct.

Indirect Routing $\Rightarrow$ where however if the passengers have to travel b/w two cities via one or more intermediate cities where the passenger changes flight this is known as indirect routing.

Factors calculation of indirect routing based on two principle.

1. ~~on~~ Specified Routing.
2. Milage principle.

⇒ Specified Routing ⇒ In case of certain cities some specified fares are published along with specified intermediate cities. these specified fares of these specified routing may have certain like

1. Know No City may be added to the routing.
2. Geographical cannot be change.
2. Service may be restricted

⇒ Milage Principle ⇒ The milage principle is basic on Four basis element per element.

1. MPM (Maximum Permitted Milage)
2. TPM (Ticketing Point Milage)
3. EMA (Extra Milage allow.)
4. EMS (Excess Milage Surcharge)

- **MPM** $\Rightarrow$ These are the maximum amount of Mileage that a passenger is allowed to fly at a Published fare of the required routing b/w the origin and destination. The MPM are Published of one way or half return or half around trip. Then more than one fares and MPM are published b/w the then apply the fare and the MPM according to the applicable global inter indicator.

- **TPM** $\Rightarrow$ (Ticketed Point mileage)
Ticketed point are the cities in the routing of which ticket is been issued. Ticketed Point mileage (TPM) is generally the direct or non stop distance b/w two ticketed point for each pair of cities of which the ticket is been issued. TPM have to be considered when one or more TPM's are published b/w the same two cities pair then apply the TPM according to the global indicator.

Application of the mileage System:

1. Total the TPM's b/w the cities on the actual itinerary.
 2. Find the MPM b/w the origin and the destination.
 3. Compare the total TPM with the MPM.
 4. If the total TPM's is equal to or less than the MPM then the cities in the itinerary. Can be covered at the direct published fares b/w the origin and the destination.
- If the total TPM exceeds the MPM then the fare will have to be increased by a certain percentage. This is called excess mileage surcharge (EMS).

How to determine EMS.

When the total TPM is more than the MPM then we need to find the EMS as follows.

1. Divide the total TPM by MPM
(you must arrive up to atleast 5 decimal places.

2. Compare the result with the following table

• If the result is.

Over	but not higher than	Surcharge the fare by percentage
1.00000	1.05000	5%
1.05000	1.10000	10%
1.10000	1.15000	15%
1.15000	1.20000	20%
1.20000	1.25000	25%

Note: If the result is over 2.5% then we need to calculate the fare using combination fares.

$$\frac{\text{TPM}}{\text{MPM}} = 1.025$$

$$= 1.111$$

$$= 1.30$$

Extra Mileage Allowance (EMA)

In certain counting if the travel is by air or via certain specific cities than certain miles can be deducted from the total TPM before comparing the same the MPM this is known as EMA

that means we whenever we have the total TPM exceeding the MPM than before surcharging the passenger we must check of EMA in the EMA table.

$$\frac{\text{TPM} \leq}{\text{MPM}} 5\% = \boxed{5M}$$

MPM	TPM	Raw result	EMS
7943	8673	1.09190	10 M
4400	5181	1.17750	20 M
6951	7300	1.05020	10 M
12840	15809	1.23123	25 M
8871	10051	1.13301	15 M
2965	2899	0.97214	M
