$$= \frac{\sin x \cos x (1) + i \sinh y \cosh y (1 - 2 \sin^2 x)}{\cos^2 x (1 + \sin^2 y) + \sin^2 x \sinh^2 y}$$

**Q. 1. (b) Show that the function :**

$$f(z) = \begin{cases} \frac{(x^3 - y^3) + i(x^3 + y^3)}{x^2 + y^2} & , z \neq 0 \\ 0 & , z = 0 \end{cases}$$

satisfies C-R equations at the origin but does not have a derivative at origin.

**Ans.** Here,

$$f(z) = \frac{(x^3 - y^3) + i(x^3 + y^3)}{x^2 + y^2} , z \neq 0$$

Let  $f(z) = u + iv$  then

$$u = \frac{x^3 - y^3}{x^2 + y^2} , v = \frac{x^3 + y^3}{x^2 + y^2}$$

Since  $z \neq 0 \Rightarrow x \neq 0, y \neq 0$ .

$\therefore$   $u$  &  $v$  are rational function of  $x$  and  $y$  with non-zero denominators. Thus,  $u$ ,  $v$  and hence  $f(z)$  are continuous functions when  $z \neq 0$ . To test them for continuity at  $z = 0$ , on changing  $u$ ,  $v$  to polar co-ordinates by putting  $x = r \cos \theta$ ,  $y = r \sin \theta$ , we get

$$u = r(\cos^3 \theta - \sin^3 \theta)$$

and

$$v = r(\cos^3 \theta + \sin^3 \theta)$$

When  $z \rightarrow 0$ ,  $r \rightarrow 0$

FOR MORE STUDY MATERIAL LOG ON TO <http://studentsuvidha.in>

$$\therefore \lim_{z \rightarrow 0} u = u \lim_{z \rightarrow 0} r(\cos^3 \theta - \sin^3 \theta) = 0$$

$$\text{By } \lim_{z \rightarrow 0} v = 0 \quad \therefore \quad \lim_{z \rightarrow 0} f(z) = 0 = f(0)$$

$\Rightarrow f(z)$  is continuous at  $z = 0$ .

Hence,  $f(z)$  is continuous for all values of  $z$ . At the origin  $(0, 0)$ , we have

$$\frac{\partial u}{\partial x} = \lim_{x \rightarrow 0} \frac{u(x, 0) - u(0, 0)}{x} = \lim_{x \rightarrow 0} \frac{x - 0}{x} = 1$$

$$\frac{\partial u}{\partial y} = \lim_{y \rightarrow 0} \frac{u(0, y) - u(0, 0)}{y} = \lim_{y \rightarrow 0} \frac{-y - 0}{y} = -1$$

$$\frac{\partial v}{\partial x} = \lim_{x \rightarrow 0} \frac{v(x, 0) - v(0, 0)}{x} = \lim_{x \rightarrow 0} \frac{-y - 0}{y} = 1$$

$$\frac{\partial v}{\partial y} = \lim_{y \rightarrow 0} \frac{v(0, y) - v(0, 0)}{y} = \lim_{y \rightarrow 0} \frac{y - 0}{y} = 1$$

$$\therefore \quad \frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}$$

$$\text{and} \quad \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$$

Hence, CR equations are satisfied at origin.

Now,

$$f'(0) = \lim_{z \rightarrow 0} \frac{f(z) - f(0)}{z} = \lim_{z \rightarrow 0} \frac{(x^3 - x^3) + i(x^3 + y^3)}{(x^2 + y^2)(x + y)}$$

Let  $z \rightarrow 0$  along the line  $y = x$  then

FOR MORE STUDY MATERIAL LOG ON TO <http://studentsuvidha.in>

$$f'(0) = \lim_{x \rightarrow 0} \frac{0 + 2ix^3}{2x^3(1+i)} = \frac{i}{1+i} = \frac{i(1-i)}{2} = \frac{1+i}{2} \quad \dots(2)$$

Also, let  $z \rightarrow 0$  along the  $x$  axis ( $y = 0$ ). Then

$$f'(0) = \lim_{x \rightarrow 0} \frac{x^3 + ix^3}{x^3} = 1+i \quad \dots(2)$$

Since the limits (1) and (2) are different

$\Rightarrow f'(0)$  does not exist.

Q. 4. (ii) Evaluate  $\int_C (z - z^2) dz$  where  $C$  is the upper half of the circle  $|z - 2| = 3$ . What is the value of the integral if  $C$  is the lower half of the above given circle?

Ans.  $\int (z - z^2) dz$

As  $|z - 2| = 3$

$\Rightarrow z - 2 = 3e^{i\theta}$

$$z = 2 + 3e^{i\theta}$$

$$dz = 3ie^{i\theta} d\theta$$

$$\int_0^{\infty} \frac{dx}{(a^2 + x^2)^2} = 2\pi i \left[ -\frac{i}{4a^2} + \frac{ii}{4a^3} \right]$$

**Q. 6. (a)** A box contains 9 tickets numbered 1 to inclusive. If 3 ticket are drawn from the box one at a time, find the probability they are alternatively either odd, even, odd or even, odd, even.

**Ans.** Because box contain 9 tickets number 1 to 9

Even numbers are 2, 4, 6, 8

Odd numbers are 1, 3, 5, 7, 9

If they are alternating in the order (A)

Odd even odd

Then the probability is

$$\frac{{}^5C_1}{{}^9C_1} \times \frac{{}^4C_1}{{}^8C_1} \times \frac{{}^3C_1}{{}^7C_1}$$

$$= \frac{5}{9} \times \frac{4}{8} \times \frac{3}{7} = \frac{10}{63}$$

FOR MORE STUDY MATIRIEL LOG ON TO <http://studentsuvidha.in>

If they are alternatively in order B (even odd even)

$$\frac{{}^4C_1 \times {}^5C_1 \times {}^3C_1}{{}^9C_1} \times \frac{{}^5C_1 \times {}^4C_1 \times {}^3C_1}{{}^9C_1}$$

$$= \frac{4}{9} \times \frac{5}{8} \times \frac{3}{7} = \frac{5}{42}$$

→ Probability they are alternatively either odd, even odd or even, odd, even is,

$$= \frac{10}{63} + \frac{5}{42}$$

$$= 0.1587 + 0.119 = 0.27774$$

Q. 6. (b) Fit a binomial distribution to the following data :

x:	0	1	2	3	4
f:	30	62	46	10	2

Ans.

x	f	q(x)
0	30	0
1	62	62
2	46	92
3	10	30
4	02	08
N = Σf = 150

$$\Sigma fx = 192$$

$$\text{Mean} = \frac{\Sigma f(x)}{\Sigma f} = \frac{192}{150}$$

$$np = 128$$

$$p = \frac{128}{4} = .32$$

$$q = .68$$

Hence, the binomial distribution to be fitted to data is,

$$150(.32 + .68)^4$$

Q. 7. (a) Mice with an average life span of 32 months will live upto 40 months when fed by a certain nutritious food. If 64 mice fed on this diet have an average life span of 38 months and standard deviation of 5.8 months, is there any reason to believe that average life span is less than 40 months.

(b) Test for goodness of fit of a Poisson distribution at 0.05 level of significance to the following frequency distribution :

No. of patients									
arriving/hour (x):	0	1	2	3	4	5	6	7	8
Frequency:	52	151	130	102	45	12	5	1	2

$$(\chi^2_{0.05} = 14.067 \text{ with } v = 7)$$

Ans. Mean of the given distribution is,

$$\begin{aligned}\bar{x} &= \frac{\sum fx}{\sum f} = \frac{0 \times 52 + 1 \times 151 + 2 \times 130 + 3 \times 102 + 4 \times 45 + 5 \times 12 + 6 \times 5 + 7 \times 1 + 8 \times 2}{52 + 151 + 130 + 102 + 45 + 12 + 5 + 1 + 2} \\&= \frac{0 + 151 + 260 + 306 + 180 + 60 + 30 + 7 + 16}{500} \\&= \frac{1010}{500} = 2.02\end{aligned}$$

In order to fit a poisson distribution to the given data, we take mean no. of poisson distribution equal to the mean of the given distribution i.e.,  $m = \bar{x} = 2.02$ .

The theoretical frequency are given by

$$f(r) = \frac{N \times e^{-2.02} (2.02)^r}{r!}$$

FOR MORE STUDY MATERIAL LOG ON TO <http://studentsuvidha.in>

$$f(0) = \frac{500 \times 0.135}{1} = 67.5 \quad r=0, 1, 2, 3, \dots, r$$

$$f(1) = \frac{500 \times 2.02 \times 0.135}{1} = 136.67$$

$$f(2) = \frac{500 \times 0.135 \times (2.02)^2}{2} = 137.71$$

$$f(3) = \frac{500 \times 0.135 \times (2.02)^3}{3} = 92.71$$

$$f(4) = \frac{500 \times 0.135 \times (2.02)^4}{4} = 46.82$$

$$f(5) = \frac{500 \times 0.135 \times (2.02)^5}{5} = 18.91$$

$$f(6) = \frac{500 \times 0.135 \times (2.02)^6}{6} = 6.36$$

$$f(7) = \frac{500 \times 0.135 \times (2.02)^7}{7} = 1.83$$

$$f(8) = \frac{500 \times 0.135 \times (2.02)^8}{8} = 0.46$$

**Q. 8. (a) Solve the following L.P.P. graphically :**

$$\text{Maximize } Z = 3x_1 + 4x_2$$

**Subject to :**

**Ans.**

FOR MORE STUDY MATERIAL LOG ON TO <http://studentsuvidha.in>

max  $Z = 3x_1 + 4x_2$

Sub. to  $4x_1 + 7x_2 \leq 140$

$$2x_1 + 5x_2 \leq 130$$

$$x_1, x_2 \geq 0$$

Corresponding equality is

$$4x_1 + 7x_2 = 140 \Rightarrow \begin{bmatrix} x_1 & 0 & 20 \\ x_2 & 40 & 0 \end{bmatrix}$$

$$2x_1 + 5x_2 = 130 \Rightarrow$$

Optimal is at  $(0, 0), (20, 0), (0, 35)$

$$O(0, 0), A(20, 0), B\left(\frac{5}{7}, 35\right), C(0, 35)$$

$$Z_O = 0$$

$$Z_A = 3(20) + 4(0) = 60$$

FOR MORE STUDY MATERIAL LOG ON TO <http://studentsuvidha.in>

$$Z_B = 3\left(\frac{5}{2}\right) + 4(35) = \frac{15}{2} + 140 = 147.5$$

$$Z_C = 3(0) + 4(36) = 144$$

Max. value at B (5/2, 35)

$$\boxed{Z_B = 147.5}$$

Convert the " $\geq$ " type constraint to " $\leq$ " type above L.P.P. takes the form..

Max.,  $Z = -3x_1 - x_2 + 0s_1 + 0s_2$

Sub to :  $-x_1 - x_2 \leq -1$

$$-2x_1 - 3x_2 \leq -2$$

Convert in equations into equation by adding slack variable.

$$-x_1 - x_2 + s_1 = -1$$

$$-2x_1 - 3x_2 + s_2 = -2$$
