# B TECH (SEM-I) THEORY EXAMINATION 2018-19 ENGG CHEMISTRY

Time: 3 Hours Total Marks: 100

Notel. AttempltBectiohfsequiareymissidgtahenhooseitably.

#### SECTION

### 1. Attemphhuestionbrief.

 $2 \times 10 = 20$ 

- a) Explain why HDPE has high density.
- b) Write a short note on racemization.
- c) Define pour point & cloud point of lubricants.
- d) What are the monomers of Buna-N and PMMA?
- e) Why is TMS used as a standard reference in NMR spectroscopy?
- f) How many phases are present in an aqueous Sucrose solution?
- g) The density of NaCl is 2.163 g/cc. calculates the edge of its cubic cell. Assuming that four molecules of NaCl are associated per unit cell.
- h) What is temporary hardness? Write the constituent responsible for temporary hardness.
- I) Give the composition of bio-gas.
- j) Explain why Helium remains monoatomic.

### **SECTION B**

## 2. Attempt any three of the following:

 $10 \times 3 = 30$ 

- a) Derive Bragg's equation. In Bragg's reflection of X-ray, a reflection was found at 30° with lattice spacing of 1.87 Å If this is a second order reflection. Calculate the wavelength of X-ray.
- b) (i) Describe proximate analysis of coal. A sample of coal was analyzed as follows: Exactly 2.5 g was weighed into a silica crucible. After heating for one hour at 110°C, the residue weighed 2.415 g. The crucible was then strongly heated or exactly 7 minutes at 950°C. The residue weighed 1.528 gm. The crucible was then heated until a constant weight was obtained. The last residue was found to be weight 0.245 gm.

Calculate the percentage results of the above analysis

- (ii) Write short note on conducting polymers.
- c) Define the term Chromospheres and Auxochrome in UV spectroscopy. An organic

Compound having molecular formula C<sub>7</sub>H<sub>6</sub>O shows absorption peaks at 3010, 2700, 1600, 1580, 1520, 1480, and 1270 cm<sup>-1</sup> in its IR spectrum. Suggest its structure.

- d) Discuss the mechanism of SN<sup>1</sup>& SN<sup>2</sup> reaction.
- e) Define phase rule. Apply phase rule to water system.

### **SECTION C**

3. Attempt any one part of the following:

 $10 \times 1 = 10$ 

a) What is the basic principle of Lime Soda process? A water sample, using FeSO<sub>4</sub>. 7H<sub>2</sub> O as a coagulant at the rate of 139 ppm gave the following results on analysis.

 $Ca^{2+} = 150 \text{ ppm};$ 

 $CO_2 = 88 \text{ ppm}$ 

 $Mg^{2+} = 80 \text{ ppm};$ 

 $HCO_3^- = 488 \text{ ppm}$ 

Calculate the lime and soda required to soften 1, 00,000 liters of water.

- b) Write short notes on:
  - (i) E,Z nomenclature.
  - (ii) Conformation of n-butane.
- 4. Attempt any one part of the following:

 $10 \times 1 = 10$ 

- a) What are organ metallic compounds? Explain various methods of preparation of organ metallic compounds and also write their applications.
- b) What is Portland cement? Give the chemical reaction involved during setting and hardening of Cement.
- 5. Attempt any one part of the following:

 $10 \times 1 = 10$ 

- a) Explain reverse osmosis. 100 ml of water sample has hardnes equivalent of 12.5 ml of 0.08 N MgSO<sub>4</sub>. What is its hardness in ppm?
- b) With the help of Molecular orbital diagram explain why NO molecule is paramagnetic
- 6. Attempt any *one* part of the following:

 $10 \times 1 = 10$ 

- a) Write the preparation, properties and applications of:
  - (i) Butyl rubber
  - (ii) HDPE
- b) Explain finger print region in IR spectrocopy. How will you distinguish between the following pairs of compounds on the basis of infrared spectroscopy:
  - (i) CH3COOH and CH3COOC<sub>2</sub>H<sub>5</sub>
  - (ii) C<sub>2</sub>H<sub>5</sub>OH and C<sub>2</sub>H<sub>5</sub>OC<sub>2</sub>H<sub>5</sub>
- 7. Attempt any one part of the following:

 $10 \times 1 = 10$ 

- a) What is Crystal imperfection? Explain the zero dimensional imperfection in solid.
- b) Write the mechanism of electrochemical or wet corrosion. Explain sacrificial anodic and impressed current cathodic protection method for prevention of corrosion.
