# **DATA STRUCTURES**

### Time: 3 Hours

Note: 1. Attempt all Sections. If require any missing data; then choose suitably. **SECTION A** 

Roll No:

BTECH (SEM III) THEORY EXAMINATION 2021-22

#### 1. Attempt all questions in brief.

| a. | Describe the terms time and space complexity.                                                                                                    |
|----|--------------------------------------------------------------------------------------------------------------------------------------------------|
| b. | Distinguish between calloc() and malloc() function.                                                                                              |
| c. | Calculate the address of the 3 <sup>rd</sup> element of an integer array A[6][2] using the starting address 2000.(Assume integer takes 2 bytes). |
| d. | Write postfix notation of infix expression $a^{*}(b+c/d)$ .                                                                                      |
| e. | Illustrate the data structure that follows LIFO order.                                                                                           |
| f. | Compare complete binary and strict binary trees.                                                                                                 |
| g. | Write the time complexity of quicksort and bubble sorting algorithm                                                                              |

### **SECTION B**

#### 2. Attempt any *three* of the following:

| a. | Consider 20 X 5 two-dimensional array "marks" which has its base address = 1000           |
|----|-------------------------------------------------------------------------------------------|
|    | and the size of an element = 2. Calculate the address of the element, $marks[18][4]$      |
|    | according to row-major order and column-major order. Write the general formula for        |
|    | finding the address of the multidimensional array.                                        |
| b. | Describe the term stack data structures. Illustrate the implementation of different stack |
|    | operations with help of a program.                                                        |
| c. | Define the term BST. Explain different types of tree traversal techniques with help of    |
|    | an example.                                                                               |
| d. | Write the Quicksort gorithm and illustrate the steps of the algorithm to sort the         |
|    | following data: 25, 943, 454, 75, 28, 148, 435, 566, 34.                                  |
| e. | Apply prims accorthm to find the minimum cost spanning tree on the given graph.           |
|    |                                                                                           |
|    |                                                                                           |
|    |                                                                                           |
|    |                                                                                           |
|    | 5 7 8                                                                                     |
|    | E G                                                                                       |
|    |                                                                                           |
|    |                                                                                           |

### **SECTION C**

#### 3. Attempt any *one* part of the following:

### 7 x 1 = 7

| (a) | Illustrate the structure of the doubly linked list. Write an algorithm to add a new node   |
|-----|--------------------------------------------------------------------------------------------|
|     | at the end of the doubly-linked list.                                                      |
| (b) | Illustrate the structure of the circular linked list. Write an algorithm to add a new node |
|     | at the beginning of the circular linked list.                                              |

#### 4. Attempt any *one* part of the following:

### $7 \ge 1 = 7$

| (a) | Demonstrate the step-by-step conversion of the following infix expression into a        |
|-----|-----------------------------------------------------------------------------------------|
|     | postfix expression.                                                                     |
|     | A - (B / C + (D % E * F) / G) * H)                                                      |
| (b) | Compare non-tail and tail recursion. Construct the recursion tree for solving the tower |
|     | of Hanoi problem with n=4.                                                              |

Roll No:

BTECH (SEM III) THEORY EXAMINATION 2021-22

### DATA STRUCTURES

### 5. Attempt any *one* part of the following:

| (a) | Construct the binary tree using the following traversals                           |
|-----|------------------------------------------------------------------------------------|
|     | In-Order Traversal : D B H E I A F J C G                                           |
|     | Post-Order Traversal: D H I E B J F G C A                                          |
| (b) | Construct the Huffman tree using the following (node, Frequency) pairs A 7, B 9, C |
|     | 11, D 14, E 18, F 21, G 27, H 29, I 35, J 40.                                      |

### 6. Attempt any *one* part of the following:

### 7 x 1 = 7

7. Attempt any one part of the following:

7 x 1 = 7

| (a) | Describe the term AVL Tree. Illustrate step-by-step construction of AVL tree using the following data. 23,45,13,56,4,6,7,32,84,89,37,96 |
|-----|-----------------------------------------------------------------------------------------------------------------------------------------|
| (b) | Write a program to implement merge sort algorithm.                                                                                      |
