Code No: R100506 Pre-Ph.D. Examinations. February - 2020

ADVANCED CONCRETE TECHNOLOGY

Time: 3 hours Max.Marks:100

Answer any FIVE questions All questions carry equal marks

- - -

NOTE: USE OF MIX DESIGN CHARTS PERMITTED. IS OCDES NOT PERMITTED.

- 1.a) Explain in detail the role of SILICATES in hydration of cement?
 - b) Explain the difference between continuous grading and gap grading? Also explain their merits and demerits? [10+10]
- 2.a) Explain the terms 'segregation' and 'bleeding' of concrete? Explain mechanism, reasons and controlling methods?
 - b) Calculate the Gel/Space ratio and estimate the strength of concrete for 800 grams of cement with 0.6 and 0.7 w/c ration on 75% hydration? [10+10]
- 3.a) Explain the term EFFECTIVE WATER in concrete? How it can be calculated?
 - b) Explain in detail different types of shrinkages in concrete? [10+10]
- 4.a) Explain the reason for keeping the H/D ratio of concrete cylinder as 2. What to do if it is more or less than 2?
 - b) With neat creep curve explain the creep behavior of concrete? [6+14]
- 5. Design a M55 grade concrete mix using ERINTROY AND SHAKLOK method for very good quality control. The workability is very low. Cement is OPC 53 grade with a sp.gravity of 3.40.CA is crushed granite 12 mm size with a sp.gravity of 2.65. FA is natural sand of zone II and its sp.gravity is 2.68.The ratio of Fine to Total aggregate is 30%. Assume any other data required suitably. [20]
- 6. Discuss in detail about the Quality Management System in concrete construction industry? What are the measures to be considered to assess the quality control? [20]
- 7. Explain in detail about different types of polymer concrete?

[20]

- 8. Write short notes on:
 - a) Methods of controlling Alkali Silica Reaction
 - b) Limitations of NDT of concrete
 - c) Tests for fresh SCC

[6+6+8]
