Total No. of Pages : 02

Total No. of Questions : 09

**B.Tech (ME) (Sem.-4)**  
**APPLIED THERMODYNAMICS-II**  
Subject Code : ME-208  
M.Code : 59016

Time : 3 Hrs.

Max. Marks : 60

**INSTRUCTIONS TO CANDIDATES :**

1. SECTION-A is COMPULSORY consisting of TEN questions carrying TWO marks each.
2. SECTION-B contains FIVE questions carrying FIVE marks each and students have to attempt any FOUR questions.
3. SECTION-C contains THREE questions carrying TEN marks each and students have to attempt any TWO questions.

**SECTION-A**

**Q1. Write briefly :**

- a) Sketch a typical port timing diagram of a two stroke petrol engine.
- b) What is the need of pre .combustion chamber in D.I. Diesel engine?
- c) Explain what is work input factor in centrifugal compressors?
- d) Explain the advantages of Ram jet propulsion system.
- e) List the positive displacement type compressors of rotary design.
- f) Give comparison between reciprocating and rotary air compressors.
- g) Enlist different methods to improve thermal efficiency of open cycle gas turbine plant.
- h) List down merits of gas turbine over steam turbine.
- i) Give the classification of rotary compressors.
- j) Differentiate between Turbojet and Turboprop.

**SECTION-B**

- Q2 List out the factors affecting knocking in S.I. engine & explain these briefly.
- Q3 Explain working of Vane type Blower, also calculate the Power input.
- Q4 Define “Slip”factor in relation to Centrifugal compressor and derive an expression.

- Q5 Derive an expression for Optimum Pressure Ratio for maximum specific work output of gas turbine plant.
- Q6 Explain with neat diagram, working of Turbo-propeller engine.

### SECTION-C

- Q7 A Centrifugal compressor running at 10000 r.p.m., delivers  $660\text{ m}^3/\text{min}$ . of free air. The air is compressed from 1 bar and  $20^\circ\text{C}$  to a pressure ratio of 4 with isentropic efficiency of 82%. Blades are radial at outlet of impeller and flow velocity of  $62\text{ m/s}$  may be assumed throughout constant. The outer radius of impeller is twice the inner and slip factor may be assumed as 0.9. The blade area co-efficient may be assumed 0.9 at inlet. Calculate :
- Final temperature of air
  - Theoretical power
  - Impeller diameters at inlet and exit
  - Breadth of impeller at inlet
  - Diffuser blade angle at inlet
- Q8 A jet propulsion unit uses 35kg of air per second when flying at  $800\text{ km/hr}$ . The air is compressed from  $15^\circ\text{C}$  and 1 bar to  $182^\circ\text{C}$  and 309 bar. The temperatures of gases entering and leaving the turbine are  $815^\circ\text{C}$  and  $650^\circ\text{C}$  and then it enters into the nozzle. Assuming the isentropic efficiency of compressor and turbine is same and nozzle efficiency 90%. Neglecting the effect of ramming and fuel mass, find the following :
- Isentropic efficiency of compressor and turbine
  - Power required to run the compressor and
  - Thrust produced
- Q9 Write short notes on :
- Supercharging of I C engines.
  - Explain briefly : lift and drag, surging and choking in Axial flow compressors.
  - Application of Steady flow Energy equation Thermodynamics of rotary compressors.

**NOTE : Disclosure of Identity by writing Mobile No. or Making of passing request on any page of Answer Sheet will lead to UMC against the Student.**
